  The present sequence is the modified Pl pilin protein from P. aeruginosa. The N-terminal peptide region preferably lacks the first 15-40 residues of native P. aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers
                                                                                                                                                                                       Composition for treating comprising pilin protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Exemplary truncated P. aeruginosa Pl pilin protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the modified KB7 pilin protein from p. aeruginosa. The N-terminal peptide region preferably lacks the first 15-40 residues of native p.aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled-coil molety in the coding sequences. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The ligated plasmid DNA was transformed into an expression host. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic patients.

The present sequence is the modified PAK pilin protein from P. aeruginosa. The N-terminal peptide region preferably lacks the first 15-40 residues of native P.aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled-coil moiety in the coding sequences. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The ligated plasmid DNA was transformed into an expression host. The

The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The ligated plasmid DNA was transformed into an expression host. The individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Pseudomonas

                                                               The present sequence is the modified PAO pilin protein from p.aeruginosa. The N-terminal peptide region preferably lacks the first 15-40 residues of native P.aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled-coil moiety in the coding sequences. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The ligated plasmid DNA was fransformed into an expression host. The

                                              P.aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil heterodimer with an oppositely charged peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modified PAK pilin protein; alpha-helical forming portion; Exemplary coil; coiled coil heterodimer; host cell-receptor Pseudomonas infection; cystic fibrosis; neutropenia.

                                                                                                                                  The present sequence is the H coil truncated PAK pilin protein from P.aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic
                                                                                                              Sequence

```

```
The present sequence is the modified K122 pilin protein from P. deruginosa. The N-terminal 1-28 residues are deleted from K122 strain pilin protein. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The first five amino acid residues are not native to the K122 sequence, but are derived from an intrinsic coding sequence of the expression vector. The C-terminal residue is the Pro residue immediately upstream of the stop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition for treating or preventing Pseudomonas aeruginosa infection comprising pilin protein that can not self-assemble - \,

                                                                                                                                                                                                                                                                                                 The present sequence encodes E coil truncated PAO pilin protein from P.aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil heterodimer with an oppositely charged peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection.

The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil homodimer with an identical peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree combilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modified PAO pilin protein; alpha-helical forming portion; coiled coil homodimer; host cell-receptor site; Pseudomonas infection; cystic fibrosis; neutropenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Fig 5A; 32pp; English.

                                                                                                                                                                                                                                                                                                         Modified K122 pilin protein; alpha-helical forming portion; E coil; Exemplary coil; coiled coil heterodimer; host cell-receptor site; Pseudomonas infection; cystic fibrosis; neutropenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence is that of a submolecular unit of Bacteroides nodosus pilin protein which corresponds to at least one epitope common to structural pilin proteins of Type IV piliated bacteria. It is capable of eliciting antibodies (Abs) which bind to whole pili of type IV bacteria. The ability of the submolecular unit to produce Abs which bind to whole pili provides the basis for vaccines against type IV bacterial infections, e.g. footrot infection in ruminants.
                                                                                                         11-JUN-1999;

The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil heterodimer with an oppositely charged peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          oligomerisation of pilin protein necessary for attachment to cell during infection. The modified pilin protein is useful and prophylaxis for individuals at risk of Pseudomonas infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil homodiner with an identical peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree combilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic

                         This sequence is the C-terminal amino acid sequence of pilin from the p.aeruginosa strain KB7, one of 10 strains which were investigated. The KB7 peptide is classified in a group with C-terminal peptides containing 14 residues from Cys to Cys and is cross-reactive with surface peptides in certain bacteria and fundi. The peptides bind specifically to pulmonary epithelial cells. See also AAR25828 and AAR25900-R25908.
                                                                                                                                                  C-terminal portion of Pseudomonas aeruginosa pilin protein useful as a vaccine against non-Pseudomonas cross-reactive microorganisms for preventing bacterial and fungal infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is that of a submolecular unit of Bacteroides nodosus pilin protein which corresponds to at least one epitope common to structural pilin proteins of Type IV piliated bacteria. It is capable of eliciting antibodies (Abs) which bind to whole pili of type IV bacteria. The ability of the submolecular unit to produce Abs which bind to whole pili provides the basis for vaccines against type IV bacterial infections, e.g. footrot infection in ruminants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       P.aeuginosa

Inmunoreactivity as the peptide sequence given in AAR86701. These communoreactivity as the peptide sequence given in AAR86701. These constitution is derived from the P. aeruginosa pilin protein. The peptide of the invention is derived from the exoenzyme, ExoS. ExoS is an C. cells. It is also an adhesin. It demonstrates immunospecific binding to monoclonal antibodies PK99H and MCAI. The ExoS derived peptide has to monoclonal antibodies PK99H and MCAI. The ExoS derived peptide has to block binding of P. aeruginosa to buccal epithelial cells by blocking a cell surface receptor. It is homologous to known adhesion the P. aeruginosa pilin protein, esp. the region 131-143. These peptides may be used in vaccines to provide active immunisation be used for targetted drug delivery to pulmonary epithelial cells, e.g. chemotheranentic aments

pilin precursor - Dichelobacter nodosus
C:Species: Dichelobacter nodosus
C:Date: 10-Mar-1994 #sequence_revision
A; Molecule type: DNA
A; Residues: 1-157 <F
                                             A; Reference number: A46566; A; Accession: A46566
                                                              R;Finney, K.G.; Elleman, T.C.; Stewart, D.J. J. Gen. Microbiol. 134, 575-584, 1988 A;Title: Nucleotide sequence of the pilin gene A;Reference number: A46566; MUID:89036113
                               A; Status: preliminary
                                                                                                                   R; Finney, K.G.;

d. No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hits satisfying chosen parameters:
